Use of eSRT Electrical Evoked Stapedial Reflex Thresholds in Cochlear Implants

Doris Velasquez [A02391804] - Doc Student (w/Naveen Nagaraj)

December 08, 2022

## Background

The benefits of using eSRT Electrical Evoked Stapedial Reflex Thresholds in cochlear implants pre and post operative.

## Sample

The survey will be sent to clinician/ audiologist nationwide to find the the benefits of using eSRT Electrical Evoked Stapedial Reflex Thresholds in cochlear implants pre and post operative. Also, the success rate of this use of the objective measure .

## Hypothesis

- Do you measure eSRT? o Why not? • How frequently do you measure eSRT? o Do you do it on all patients? Some? o How frequently within the same individual (once and never again? Every visit? Once/year? • When do you first attempt to measure eSRT? (initial activation, one month, etc) o At an activation - what percentage are successful? o Why or why not would you try an eSRT at activation? • Pediatric and Adults? o Treat same or differently? • Ipsi/Contra? • How many electrodes do you measure? • How do you apply eSRT? - open question

## Progress

Introduction and literature review for proposal

## Request

Format the survey for this study

## Timeline

Propose to my committee by Jan 30th
