Minority Stress Model

Renee Galliher [A00015075] - PSY Faculty

July 27, 2022

Background

This project will use a sample of LGBTQ+ engineering college students to test a model based on minority stress theory that posits distal stressors as an IV, proximal stressors as a mediator, and psychosocial health as a DV. We posit identity affirmation and community connectedness as moderators.

Sample

n = 166

Hypothesis

proximal stressors serve as a mediator between distal stressors and outcomes. the link between stressors and outcomes is moderated by identity affirmation and community connectedness

Progress

data cleaning and initial analyses. We only need help with the SEM

Request

help running an SEM model

Timeline

hope to have the analyses done in late summer/early fall
