

Request #: 462 - HDFS - Publication/Article

mixed anovas

diana meter [A02260967] - HDFS Faculty

May 09, 2020

Background

Running mixed anovas. Pretest posttest data with different groups.

Sample

Very small N, 28 right now.

Hypothesis

Expect changes over time, and would like to control for group/see if there is an interaction with group.

Progress

Ran the analyses in R and SPSS. Would appreciate clarification about why order of entry in code matters and if I am running the analyses correctly.

Request

Would just like to share my code (toward the end of the R code file) and ask which code is correct and why.

Timeline

Abstract for presentation due May 18 so I am in a hurry to get these analyses done.
