Profiles of Adverse Life Experiences: Associations with Mental Health Outcomes Among Emerging Adults

Cynthia Navarro Flores [A02254677] - Doc Student (w/Melanie Domenech Rodriguez)

April 15, 2021

Background

I am submitting part of my thesis for publication. I ran a latent class analysis to create classes of adverse life events experienced by college students. I am seeing if there are differences in various mental health outcomes based on the adverse life experiences classes.

Sample

Data has been collected from 442 college students.

Hypothesis

It was expected that classes with more ALEs (i.e., high and moderate classes) would have increased levels of psychopathology and that the moderate ALEs classes would differentially relate to psychopathology outcomes.

Progress

Data cleaning, and some statistical analysis.

Request

I have non-normally distributed data and I am trying to figure out what test to run. I was planning to use a MANCOVA.

Timeline

Flexible.
