The Effects of Intense, Home-Based Involvement of a Child on the Autism Spectrum in Applied Behavior Analysis on the Development and Sibling Relationships of Typically Developing Siblings (IRB General - #1037

Evin Daines [A01793769] - Masters Student (w/Michelle Lizotte)

February 24, 2020

Background

We are administering an online survey to help us determine the effects of Applied Behavior Analysis on siblings of individuals with Autism Spectrum Disorder.

Sample

Survey data for approx. 150 individuals.

Hypothesis

What are the effects of intense, home-based involvement of a child on the Autism Spectrum in Applied Behavior Analysis (ABA) on the development and sibling relationships of typically developing siblings?

Hypotheses: ABA treatment in the home maintains, or even increases, levels of stress and anxiety for siblings of individuals with ASD but improves sibling relationships.

Progress

We have completed everything for the survey and protocol before receiving IRB approval and data collection with the exception of including informed consent as part of the survey. This is where we are seeking help.

Request

Assistance with survey creation on REDcap.

Timeline

We anticipate the project to require 11 months for completion; February 1st 2020- December 31, 2020
