Attribution of discrimination to the self in racial minorities and women

Natalie Rust [A02352254] - Bachelor Student (w/Melissa Ferguson)

March 02, 2022

Background

This project is an analysis of the data of coded other responses in a survey on the attribution to self in the presence of bias.

Sample

A qualtrics survey about discrimination, attributes of discrimination, parental practices, and adolescent behavior

Hypothesis

Individuals with minority status (in this case women, Latinx, and Black populations) will be more likely to attribute experienced bias to themselves rather than other factors. Females will internalize discrimination more than males. Black and Latinx students will internalize discrimination more than white students

Progress

We have coded for themes in the other responses correlated these to the individuals in the survey and run a statistical analysis on SAS on the demographic data corresponding to their coded response.

Request

Help interpreting results, and determining analysis approach or statistical test

Timeline

By the end of March
