Request #: 435 - PSY - Dissertation

App-Based Technology and Academics in Children with Autism Spectrum Disorder

Cassity Haverkamp [A02230052] - Doc Student (w/Maryellen McClain Verdoes)

December 05, 2019

Background

I am planning on conducting a three-part dissertation. The first part is a single-case design study looking at an academic number and letter learning tablet application with preschool-aged children with ASD or developmental delay. The second piece is a meta-analysis of single-case design studies looking at app-based academic interventions for children with ASD. The third study is a sample of parents of children with ASD inquiring in qualitative interviews about their perceptions of academic-based technology for intervention as well as general questions addressing technology and the ASD population.

Sample

I have collected the single-case design data with 5 preschool-aged participants. I plan to collect qualitative data with approximately 10 parents or until we reach saturation.

Hypothesis

The use of tablet applications is becoming more popular in school and clinical settings when working with children with ASD. I propose that these tools can be useful and efficient ways to teach needed academic skills to children with ASD. 1. Is a letter and number learning application effective in teaching these skills to preschool-aged children with ASD? 2. Is a letter and number learning application more effective when measured with expressive or receptive language? 3. Determine which app-based academic interventions are currently used by researchers, clinicians, and education professionals. 4. Determine the effectiveness of app-based interventions in teaching academic skills to children and adolescents with ASD. 5. Determine the effectiveness of app-based interventions in teaching academic skills to children and adolescents with ASD across condition variables (e.g., age, race/ethnicity, cognitive ability). 6. What are parent perceptions of app-based academic interventions?

Progress

Data collection is complete for the single-case design project, and I am currently running data analyses. Data collection for the meta-analysis project will be underway within the next few weeks. We are ironing out a few search terms. The third project is still in development

Request

I am seeking ongoing help during my dissertation. This may include design assistance, analytic consultation, etc.

Timeline

I am hoping to propose my dissertation at the end of spring or early in the fall. The bulk of the help I will need from the stats studio will take place in the spring 2020 semester.
